SUMMARY

Backend & AI Engineer with 1+ year of production experience designing and deploying Generative AI systems, multi-agent workflows, and scalable backend architectures. Delivered AI solutions for government entities (Maharashtra) and Fortune 500 Clients. Proficient in asynchronous Python, FastAPI, Rust, ClickHouse, Redis, and Dapr on the backend, and LangChain, LangGraph, Neo4j, and Agentic AI on the AI side.

EDUCATION

Delhi Technological University (DTU) — Delhi
Bachelor's, Engineering — *2021 – 2025*

WORK EXPERIENCE

Impact Analytics — Bellandur, Bangalore, Karnataka
Software Engineer — *September 2026 – Present*

- Developed backend services in **Rust (Axum, Tokio)** for a retail promotion-planning platform, building REST APIs with a **CQRS** command/query split, typed error handling and **OpenAPI** documentation as part of a module-by-module migration from **Python/FastAPI**.
- Worked on data and async layers using **ClickHouse** (versioned inserts, views), **Redis Streams** for background job processing, and multi-layer caching (in-process **L1** and **Redis L2**), following CI guardrails (clippy, cargo-deny, k6 load tests).

Qolaba AI — Gurugram, Haryana
SWE (Python Backend & AI) — *February 2025 – May 2026*

- Engineered a production-scale **knowledge graph** and **LLM pipeline** (**Neo4j**) to automate **OCR**-based content structuring. Solved complex data extraction bottlenecks for major educational curricula (NCERT, Maharashtra and Odisha State Boards, Bansal Classes), standardizing unstructured enterprise data at scale.
- Built production-grade pipelines for **document classification** and **multilingual translation** for the **Maharashtra Government (Tapaal)**. The system processes thousands of daily inquiries across regional vernaculars, automating document routing and drastically reducing manual triage time for state-wide operations.
- Orchestrated **agentic multi-agent workflows** for **EXL (Fortune 500)**, automating intricate business logic through modular agent design. Leveraged advanced state management and agentic frameworks to deliver high-reliability, mission-critical automation for enterprise-scale operations.
- Architected a provider-agnostic **multi-modal engine** for automated video, audio, and image synthesis, powering a global commercial rollout on **Sumo AI**. Built a polyglot backend (**Python/TypeScript**) made for horizontal scalability, successfully navigating high-concurrency traffic surges from worldwide customers while maintaining strict feature parity across disparate APIs.
- Deployed observability and evaluation pipelines using **LangSmith and Opik** across **5+ production client projects**. Tracked hallucination rates, classification precision, and translation quality to enable dataset creation and iterative prompt engineering.
- Implemented scalable Python backend services using **FastAPI and Dapr on GCP**, implementing async processing and caching for AI-heavy pipelines serving thousands of document processing requests across active client deployments.

Surepass Technologies — New Delhi
Machine Learning Intern — *July 2024 – September 2024*

- Fine-tuned **YOLOv8** models on large-scale public datasets for document and face processing achieving **0.95 mAP** in inference.
- Designed **FastAPI** services for liveness detection and document processing pipelines with **98% classification precision**.

PROJECT EXPERIENCE

Faro Narrative Detection Workflow — Link

- Built **Faro**, a production-grade AI narrative threat detection platform using a **multi-agent LangGraph pipeline** that ingests web, social, and PDF sources via **Firecrawl, Apify, and Mistral OCR** into a unified schema with entity extraction and claim isolation.
- Designed a hierarchical **Neo4j** tagging system (**178-node, 5-layer threat taxonomy**) with **text-to-Cypher GraphRAG** veracity checks, a **dual Neo4j graph system**, **Voyage-4** vector indexes, LangSmith observability, and a **FastAPI SSE-streamed** report endpoint deployed on **Vercel**.

SKILLS

Languages & Frameworks: Python (Advanced/Async), Rust, TypeScript, SQL, FastAPI, Axum, Tokio, Dapr, Redis, ClickHouse, Kafka
AI & Orchestration: LangChain, LangGraph, Agentic AI (Agno), Graph RAG (Neo4j), Vector Databases
MLOps, Vision & Infrastructure: LangSmith, Opik, HuggingFace, YOLOv8 (Ultralytics), GCP, Docker, Git, Bash, Linux
